REPORT BOOST
By OpenWacca

Description

ReportBoost is a 100% Salesforce Native application that adds a layer of visualization on top of existing Salesforce reports.

Data Access

ReportBoost runs "With Sharing" enabled, so it respects and relies on your organization's defined permissions and sharing configuration to determine the records and reports that users can access.

Data Security, APIs and 3rd Party Applications

ReportBoost does not define any custom API endpoints within Salesforce. ReportBoost does not connect to any applications, APIs or websites outside of Salesforce. Your data never leaves Salesforce.

Data Modification

ReportBoost does not modify, create, delete, or undelete any records in your organization.

Data Collection

The only information that OpenWacca collects or stores is the total count of users that are assigned the permission set, for billing purposes. OpenWacca does not collect or store any other information about your organization or users.

Data Sharing

OpenWacca does not share any of your information with anyone, for any reason.

Metadata Modification

ReportBoost does not modify reports, or any other metadata outside of the components that are included in the managed package.

3rd Party Libraries

ReportBoost does not use or include any 3rd party libraries. All code in the solution is developed in-house by OpenWacca.

SQL injection

ReportBoost does not leverage dynamic queries, or url parameters.

CSRF Mitigation

ReportBoost does not support URL parameters or perform any state-changing operations.
